PTX

Nucleic acid encoding heat stable esterase from thermophilic bacteria - which is active in organic solvents, useful in cheese

٥ŗ

paper manufacture, and to study plant resistance to disease

```
amplified from a paluescript vector by PCR (See T79314-16).
Claimed, newly identified polynucleotides (T79321-30) encoding cesterases (W23069-77, W23088) were recovered from genomic libraries. They can be used for recombinant production of the enzymes in host cells, and as probes to identify related sequences. The esterases care stable at high temperature and in organic solvents, making them superior for use in production of pure chiral compounds used in ceptacial, agricultural and other chemical industries. A competitor for use in production of pure chiral compounds used in machined is claimed for transferring an amino group from an amino certain compounds used in selful as ripening starters in cheese making, in lignin cremoval in paper and pulp manufacture, in carbohydrate derivative contents, in the study of plant wall structure, plant resistance to contents. The study of plant wall structure, plant resistance to contents and organic matter decomposition and to select plants bred contents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches 1017;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cc can modify TGF-beta signalling pathway are identified by screening.

Cc These are used therapeutically to treat fibroproliferative and oncogenic disorders, especially TGF (Transforming growth factor)-beta related concer, angiogenesis, inflammation, fibrosis, tumour growth and concer, angiogenesis, inflammation, fibrosis, tumour growth and concer, angiogenesis, inflammation, fibrosis, tumour growth and considered in endothelial cells subjected to laminar shear stress, can be used to design cardiovascular disease treatment strategies. Both fields to design cardiovascular disease treatment strategies. Both cf cdh540 and rchd534 are specifically expressed in vascular tissue.

Cc Interaction of the two proteins inhibits TGF-beta signalling.

Cc overexpression of fcdh540 expression constructs in pancreatic cells results in complete loss of TGF-beta response. Depending on whether the cc can be designed to increase or decrease the activity of the protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

Methods are provided for the diagnosis, monitoring in clinical trials, screening for therapeutically effective compounds, and treatment of cardiovascular diseases based on discoveries regarding the expression patterns of novel genes fchd531, fchd540, fchd545, fchd602 (see T94470) and fchd605 (see T96711). Antisense oligonucleotides (see T94486-93) and ribozymes (see T94497-99) have been designed to inhibit expression of the fchd540 gene. The gene, deposited as ATCC 69984, encodes a novel intracellular protein (see W36003) that interacts with the rchd534 gene product
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      endothelial cells subjected to fluid shear stress in vitro. Shear stress is thought to be responsible for the prevelence of atherosclerotic lesions in areas of unusual circulatory flow. Also identified were novel genes fchd531 (see T94467), which is down-regulated in endothelial cells under turbulent and laminar shear
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          used

```
amino benzoquinone and axiridine ring systems. The S. lavendulae micomychn biosynthetic gene cluster comprises 47 mitomych genes spanning CC 55kb of DNA. The invention includes an expression cassette comprising a micomych biosynthetic gene operably linked to a promoter, and host cells CC transformed with the cassette. The nucleotide, and protein sequences and the transformed host cells of the invention result in antiasthmatic, antiinflammatory, cytostatic, immunomodulatory, and antibiotic cativitles. The nucleotide sequences are used to elucidate the molecular CC activitles. The nucleotide sequences are used to elucidate the molecular compines for the biosynthesis of novel natural products, e.g. antibiotics, anti-inflammatory agents, anti-cancer agents, immune-enhancers, cimmunosuppressants, agents to treat asthma, chronic obstructive pulmonary disease as well as other disease involving respiratory inflammation, or cholesterol-lowering agents or a crop protection agents (e.g. fungicides or insecticides) as well as bipolymers, e.g., in packaging or biomedical applications, or to engineer pHA monomer synthases. Sequences

  CC from the milcomycin biosynthetic gene cluster Mitomycins are a group of CC mitomycin biosynthetic gene cluster Comprises 47 mitomycin biosynthetic gene cluster comprises 47 mitomycin biosynthetic gene cluster comprises 47 mitomycin genes spanning CC mitomycin biosynthetic gene cluster comprises 47 mitomycin genes spanning CC fish of DNA. The invention includes an expression cassette comprising a CC mitomycin biosynthetic gene operably linked to a promoter, and host cells CC transformed with the cassette. The nucleotide, and protein sequences and CC antiinflammatory, cytostatic, immunomodulatory, and antibiotic activities. The nucleotide sequences are used to elucidate the molecular basis for the biosynthesis of the mitosane ring system, as well as to cengineer the biosynthesis of novel natural products, e.g. antibiotics, and infilammatory agents of novel natural products, e.g. antibiotics, and infilammatory agents to treat asthma, chronic obstructive pulmonary disease as well as other disease involving respiratory inflammation, or cholesterol-lowering agents or as crop protection agents (e.g. fungicides or insecticides) as well as bipolymers, e.g., in packaging or biomedical applications, or to engineer PNA monomer synthases. Sequences CC 55782-C55814, C55815-C55849 and 832485-B3242 represent mitomycin biosynthetic gene cluster DNA sequences and encoded proteins. Sequences (c. 55812-C55814, C55850-C55865 and C55862-C55869 represent PCR primers used (c. 55812-C55814) and c55863-C55869 represent PCR primers used (c. 55812-C55814).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel nucleic acid molecule comprising mitomycin biosynthetic gene cluster useful for cloning mitomycin biosynthetic genes for elucidating the molecular basis of mitosane ring system biosynthesis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               anti-inflammatory;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Mitomycin; biosynthesis; mitosane ring system; antibiotic; anti-cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        C55842;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                C55842 standard; DNA; 53500 BP

                                                                                          Alternatively the effect of a candidate agonist or antagonist compound on the production of mRNA encoding METPRO02 may be detected using an ELISA assay. Diseases or conditions arising from altered expression or activity of METPRO02 may be diagnosed by detecting METPRO02 in a sample from a patient or detecting a mutation in the nucleotide encoding METPRO02 in the genome of a patient. These diseases or conditions include cancers, asthma, Parkinson's disease, Alzheimer's disease, and appears of the patient of the 
                                                                                                                                                                                                                                                                                 The present sequence encodes human aminopeptidase METPRO02. METPRO02 may be used to screen for its agonists or antagonists by contacting METPRO02 with the candidate compound and detecting any alteration in activity of METPRO02 or in a label attached to the candidate.
                     depression, diabetes, hypertension, stroke, respiratory diseases and inflammatory disorders. Detection of the nucleotide sequence may be used for chromosome mapping and tissue localization. METPRO02 and its
     nucleotide sequence may
                                                                                                                                                                                                                                                                                                                                                                                                                Claim 9; Page 13; 24pp; English.

Antibodies against METPRO02 may be used to isolate or identify clones expressing METPRO02 or to purify METPRO02 by affinity chromatography. METPRO02 may also be used to identify molecules which interact with it in or on the surface of cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1434

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     METPRO02 with the candidate compound and detecting any alteration
in activity of METPRO02 or in a label attached to the candidate.
Alternatively the effect of a candidate agonist or antagonist compound
on the production of mRNA encoding METPRO02 may be detected using an
ELISA assay. Diseases or conditions arising from altered expression or
activity of METPRO02 may be diagnosed by detecting METPRO02 in a sample
from a patient or detecting a mutation in the nucleotide encoding
METPRO02 in the genome of a patient. These diseases or conditions
conclude cancers, asthma, parkinson's disease, Alzheimer's disease,
depression, diabetes, hypertension, stroke, respiratory diseases and
inflammatory disorders. Detection of the nucleotide sequence may be
used for chromosome mapping and tissue localization. METPRO02 and its
nucleotide sequence may be administered to patents as vaccines or as
part of a gene therapy regime respectively, to treat the diseases and
conditions listed above. Antibodies against METPRO02 may be used to
isolate or identify clones expressing METPRO02 or to purify METPRO02 by
affinity chromatography. METPRO02 may also be used to identify molecules
which interact with it in or on the surface of cells.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents the BLM (Bleomycin) gene cluster, containing open reading frames (ORFS) 8-30. The proteins encoded by the gene cluster are useful for producing peptides and/or polyketide metabolites, especially bleomycin or bleomycin analogues. They are also useful for chemically modifying biological molecules to produce branched methyl groups, and for coupling amino acids and fatty acids. They may be reacted with an apo-carrier protein and coenzyme A to produce a holo-carrier protein. The BLM gene cluster or catalytic domains can be used individually or collectively to produce thiszolidine, thiszoline, bithiszoline and bithiszoline-containing microbial metabolites. The BLM gene cluster may also be used to produce
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New bleomycin gene cluster components useful for peptide and/or polyketide metabolites, especially bleomycin, production and for chemically modifying biological molecules -

                                                                                                                                                                                                                                                                                                                                       release channel gating. Analysis of surrounding sequences suggests that this mutation lies within a beta strand domain comprising roughly of amino acids 520 to 830. RYR1 is the calcium release channel of the sarcoplasmic reticulum and is a large protein which spans the gap between the transverse tubule and the sarcoplasmic reticulum. The cannel is activated by ATP, calcium, caffine, and micro-molar ryanodine. It is inhibited by ruthenium red, tetracaine, calmodulin,
                                                                                                                                                                                                                                                                                                                                                                                                                                              The sequence given is the mutant pig ryanodine receptor (RYR1) gene from swine cDNA. The polymorphic sites were observed in comparisons of Pietrain and Yorkshire breeds. There are 17 polymorphisms between the two breeds. The polymorphism at position 1972 causes a mutation from Arg to Cys and this is thought to be the molecular basis of porcine malignant hyperthermia (MH). This mutation lies within the region of RYR1 that is concerned with the binding of regulators of Ca2+
                                                                                                                                                        2414
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Purified DNA mol. for diagnosis of porcine malignant hyperthermia - comprises DNA sequence encoding normal or mutant ryanodine receptor with specified endonuclease restriction map

                                                                                                                                                                                                                                                              The COUP-TF protein was isolated from nuclear extracts of HeLa cells and acquired mRNA used to construct a cDNA library.

The COUP-TF gene and antibodies are used in assays for determining the amt. of COUP-TF, its binding ability and promoter interaction.

These assays can be used to detect defects in the COUP-TF binding system that result in diabetes. Additionally promoters associated with e.g. very low density lipoprotein gene and the pro-opiomelanocortin gene can also be assayed to detect lipoprotein abnormalities (e.g. atherosclerosis) and neurogenic and adrenal disorders, resp. See also Q06156, -57, -59 and Q06427.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Chicken ovalbumin upstream promoter transcription factor; COUP-TF; antibodies; diabetes; very low density lipoprotein gene; insulin; pro-opiomelanocortin gene; atherosclerosis; adrenal dysfunction; ss

The nucleotide sequences can be used as primers and probes for methods for detecting and identifying mycobacteria, especially belonging to the M. tuberculosis complex. The encoded proteins can be used in vaccines for immunisation against a bacterial or viral infection.

                                                                                                                                                                                                                                                                                                                                                                                                                                   proteins from various Mycobacterium species microorganisms. The nucleotide sequences can be used as primers and probes for methods for detecting and identifying mycobacteria, especially belonging to the M. tuberculosis complex. The encoded proteins can be used in vaccines for immunisation against a bacterial or viral infection.

The nucleotide sequences can be used as primers and probes for methods for detecting and identifying mycobacteria, especially belonging to the M. tuberculosis complex. The encoded proteins can be used in vaccines for immunisation against a bacterial or viral infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gicquel B, Lim EM, Guigueno A;
